

PENINSULA FLYER

South Bay

SoCal

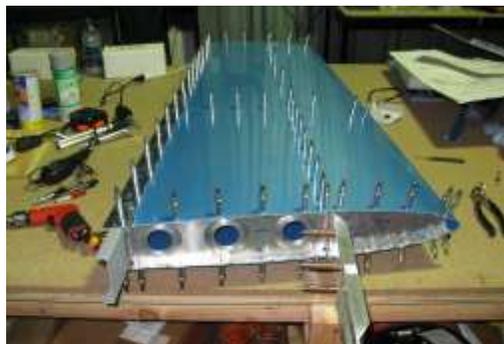

Meeting On 07/21/2012 @ 10am

July 2012

Editors Corner

Xavier Marshall

EAA Ch

President's Report

Keith Spreuer

Here it is July, prime flying weather in SoCal. Some members are off to Oshkosh soon and those staying behind are getting the place ready for our annual Flying and RC expo. This month prep for that is in full swing. We are very actively seeking more volunteers. I have 27 so far but want 60 in order to keep it down to 3 hr shifts. Please send me an email or call if you and any members of your family and friends can help. My email is kspreuer@yahoo.com and my phone is [310 692-5648](tel:3106925648). The Expo is shaping up really well. We are getting sponsors to sign up and the RC show will be even better this year. We will not only have the regular RC's but there will be a separate "Line Control" expo too. Both will have better viability than last year too. The Banner Tow Ops are a big hit and those will be on going. The food service this year will not include breakfast but the lunch service is expected to be organized better with shorter lines. Attendees are encouraged to bring a folding chair as seating is always at a premium. The video from last year is posted on the Expo web site at www.aviation4fun.com. It shows a great sample of the activities we have and is a good motivation for attendees. Spread the word to all your friends, neighbors and colleagues.

Our next meeting will be July 21st. I'm hoping Ariel Hazi will be back from vacation and have time to speak about his project. If not I have a selection of movies for us. There will be a Young Eagles event after the meeting that day. I believe that one is at HHR. Hopefully those going can hit the meeting and then head to Hawthorne. ■

INSIDE THIS ISSUE

- 4 Calendar of Events,2012 Officers and Advisors

Hangar Report

Keith Spreuer

The hangar remained unchanged in June. Upcoming changes are that the Bulldog is moving out but Robert Cullinan's Champ is coming back in. Steve Cass is also going to come in with his Sonex for a couple months to do some engine work. The Sereph project by Ike Aerospace is going to leave in August also. It is moving to Whiteman airport where Noe can work on it without such a commute.

So in July we have 1.5 small spaces vacant and 2 large spaces vacant. One of these vacancies includes the space used for tools. In August there is expected to be 2.5 small vacant and 1 large vacant. We will be moving the front row out for the expo with the Champ and Cozy on display outside. Carl's Pietenpol will be put together too for display. Of course we need to do some house cleaning before the Expo too. That will be the focus over the next 3 Saturdays. Your help is always appreciated.

■

Thunderbirds

Dennis Lord

On May 20, 2012, Dennis Lord treated guests to VIP seats at March ARB for the USAF Thunderbirds show. Shown is Rhon Williams, EAA 96 member.

Also in the show and doing an aerobatic routine was John Collver's beautiful SNJ-5 "War Dog". In 1979, War Dog was restored in the EAA 96 hangar when operated by Warbirds West. A week later, on Memorial Day, Dennis honored Veterans with a flyover of the Green Hills services in War Dog.

How To: Check your Com Antenna to Find Weak Areas of Signal

Bob Archer

I strongly suggest that on any antenna installation a flight test to check the radiation pattern should be considered. In the particular instance of the Com antenna in front of the vertical stabilizer I believe there would be a significant reduction of signal in the aft direction because of the energy being reflected forward and upwards by the vertical stabilizer. On a belly mounted antenna the landing gear legs can have a significant effect on the pattern. On a wing tip mounted COM antenna I would guess that reception

would be reduced on the opposite side. I do not have an aircraft of this type so I have not done the test myself. If someone would do the test and let me know the results I would be eternally grateful.

One way to accomplish this type of test follows: Climb to an altitude of about 5000 ft. and tune in to an airport ATIS signal at some range at which the signal is readable but sort of scratchy and fly flat circles and listen for the signal fading out and back in and record the directions off the nose of the signal loss. Don't attempt this test using the volume control to set the audio level because you have to get far enough away from the station to prevent the automatic gain control of the radio from working. It would be best to have a flat surface between the transmitter and the airplane because hills and valleys and such would have an effect. Water would be good. I tried this a while back with my belly mounted antenna installed next to the access panel on my Bellanca and I had equal signal all the way around. I was about 70 miles from Palomar airport in Southern California tuned to their ATIS and over the ocean south of the Palos Verdes peninsula.

A similar test could be performed on VOR antennas by using the flag indicators on the instruments or the audio level but the audio on the VORs is pretty weak.

Good luck on our drag free and better performing antennas.

■

Stu's New Project

Xavier Marshall

Boy, that didn't take long! It was reported in the last newsletter that Stu sold his rocket. Now, I am happy to report that he acquired a new project; a Smith Mini plane. It's a single seat biplane fighter that looks like a blast to fly.

Continued from page 2

He is in the process of taking it down for a thorough inspection, and some tweaks before it is ready to take to the air.

I had the honor of taking part in one of Stu's traditions; hanging the wing. I'm wondering what kind of paint job will go on this fighter... I mean airplane.

Comment on Medical Exemption Request By July 2

EAA.ORG

The FAA is allowing a short 20-day official public comment period for the EAA/AOPA third-class medical certification exemption request, beginning with the notice [published in today's Federal Register](#).

The 20-day public comment period, which ends July 2, is shorter than the typical 30- or 60-day period established for comments. More than 1,800 public comments have already been submitted on the exemption request through the Regulations.gov website. Those comments will be included as part of the docket on the exemption request, which was unveiled in late March as a way to significantly reduce a substantial economic and regulatory burden for pilots

who fly recreationally.

"The short comment period makes it more urgent that people submit their comments now. If you have not commented on our exemption request, do it as soon as possible, because this request opens an important discussion about creating more participation in aviation while maintaining a high safety standard," said Sean Elliott, EAA's vice president of advocacy and safety. "Make your voice heard now as part of our 'Drive for 3,000' comments on this important initiative."

Current FAA regulation 14 CFT Part 61 requires all pilots to hold at least a third-class medical certificate to exercise the privileges of a private or recreational certificate. EAA and AOPA are asking the FAA for an exemption to that rule, which would give pilots who fly recreationally the option of getting a third-class medical or, instead, participating in a recurrent online education program that will teach them how to self-assess their fitness to fly. If the request is granted, pilots flying recreationally would be required to carry the online education program course completion certificate during each flight.

The exemption would allow completers of the online program to medical self-certify for single-engine aircraft with 180 hp or less, four seats or fewer, fixed gear, and day VFR flight with one passenger

NTSB Spotlights Safety Factors for Homebuilt Aircraft

EAA.ORG

The National Transportation Safety Board today [highlighted 16 recommendations](#) to improve homebuilt aircraft safety, but also complimented EAA and its programs as helping to make the amateur-built aircraft community a safer place.

The NTSB made its recommendations at a full board meeting in Washington, D.C., following a briefing by agency staff on an extensive safety study of homebuilt aircraft that began in 2011. EAA assisted NTSB with an initial survey by encouraging involvement of EAA members, in an effort to establish an accurate, comprehensive database of the homebuilt community. More than 5,000 EAA members participated in the survey.

Among the areas of focus within the 16 NTSB recommendations were flight testing procedures and plans, development of operational limitations and flight manuals for homebuilts,

transition training, expanding availability of transition training, and use of electronic data to develop flight test plans and operations manuals.

"One of the most important findings of this study is the number of seasoned and experienced pilots getting into accidents so early in the life of structurally sound airplanes," said NTSB Chairman Deborah Hersman. "The recommendations we issue today can improve safety while encouraging the continued growth of this innovative and vibrant segment of the aviation community."

Hersman and other board members specifically cited EAA's contributions to amateur-built aircraft safety, and recommended four areas where EAA can expand its programs and play a leading role in enhancing safety.

"We appreciate the NTSB board's unanimous acknowledgement that the amateur-built aircraft community is an important element in the growth and innovation for all of aviation," said EAA President/CEO Rod Hightower. "We appreciate the praise that the board publicly gave to EAA's programs and efforts on behalf of safety. We understand the need to balance safety with the freedoms that allow Americans to use their imagination and skills to create aircraft that bring new technology and designs."

EAA and its Homebuilt Aircraft Council will continue to study the recommendations for what effect they may have on the design, building and certification of amateur-built aircraft. Any action must ensure that the freedom to participate in the amateur-built aircraft community does not create additional burdens or hurdles.
